

Smartphones or tablets (all types)

USING FEEM TO SHARE DOCUMENTS WITHOUT THE INTERNET

2017

The Feem mobile app makes it easy to send and receive files between smartphones, tablets and computers.

WHAT IS THE PURPOSE ?

A local WiFi network is a system that connects different media devices that are close to one another without needing to use an internet connection (a bit like Bluetooth). It makes it easy for partners or beneficiaries to share documents with one another when they are in the same place (e.g. a photo that has just been taken or a document that you wish to share).

- Simplified sharing, without needing to send an email or limit the number of files
- Secures exchanges by avoiding the internet
- No costs associated with the use of mobile phone data

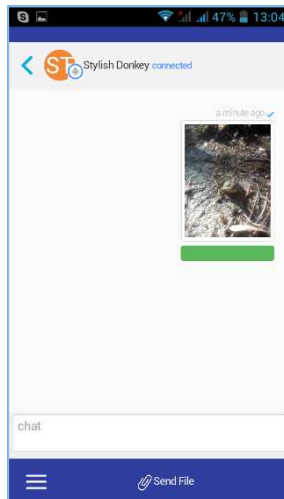

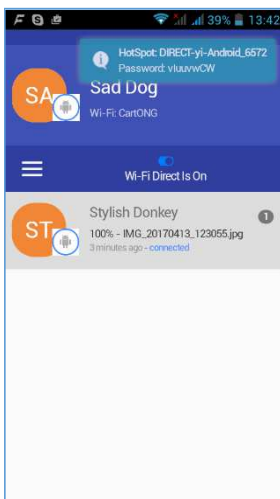

- Necessary to be close to the smartphone/tablet/computer that you wish to share with

Prerequisite

- Install Feem on all devices you wish to share with by downloading it through the app store (e.g. « Google Play Store »)

HOW TO DO IT?

1. Open the app
2. Make sure that the different devices are connected to the same Wifi network (open a local Wifi network without connecting to 3G or Wifi by selecting « Wi-Fi Direct is ON » in the application and entering the password generated by the other devices)
3. Share the document in question with the individuals whose devices are connected to the Wifi network.

A local Wifi connection does not require an internet connection (whether 3G or Wifi) – an interesting solution for sharing documents between devices that are close to one another and do not have internet access.
